

SECV3263 MULTIMEDIA WEB PROGRAMMING

SEMESTER 2 2025/2026

ALTERNATIVE ASSESSMENT – INDIVIDUAL SELF REFLECTION

Name: HAZIQ BIN SHAHMEN
Matric No: A23CS0082
Role: Lead Frontend Developer & UI/UX Specialist

For this project, I was responsible for developing and refining the User Interface (UI) and User Experience (UX) of our interactive 3D Portfolio Website. My main contributions included completely redesigning the Contact Us section into a responsive, vertically scrolling layout with glassmorphic cards that integrate WhatsApp, Email, LinkedIn, and GitHub links. I also improved the Project Gallery by adding gradient overlays for the thumbnails and fixing multimedia display bugs. Furthermore, I polished the site's overall aesthetics by applying modern CSS techniques, such as dynamic text-glow effects in the Hero section, ensuring typography remains readable when floating over moving 3D objects.

The main challenge I encountered was ensuring consistent visual contrast across the website when toggling between Light and Dark themes. Initially, several UI elements were hardcoded with dark-mode colors, making text invisible against bright backgrounds in daylight mode. I resolved this by completely refactoring the CSS to use dynamic theme variables, allowing the UI to seamlessly adapt. Another significant challenge was debugging deployment errors on Vercel, where images failed to load due to Git case-sensitivity caching issues. I overcame this by methodically renaming the assets through Git and updating our data structures to force the live server to recognize the correct files.

Through this project, I gained practical experience in modern front-end development, responsive layout design, and advanced CSS techniques like dynamic theming. I also learned the intricacies of deploying web applications and resolving environment-specific bugs, which provided a realistic look into professional workflows. If I were to improve this project further, I would implement more advanced micro-animations for user interactions and optimize asset-loading strategies for lower-end devices. Overall, this assessment greatly expanded my technical capabilities in building immersive and functional web experiences.
